

# 1 Quotient Groups and Homomorphisms

## 1.1 Definitions and Examples

**Definition.** If  $\phi$  is a homomorphism  $\phi: G \rightarrow H$ , the *kernel* of  $\phi$  is the set

$$\{g \in G \mid \phi(g) = 1\}$$

and will be denoted by  $\ker\phi$  (here 1 is the identity of  $H$ ).

**Proposition 1.** Let  $G$  and  $H$  be groups and let  $\phi: G \rightarrow H$  be a homomorphism.

1.  $\phi(1_G) = 1_H$ , where  $1_G$  and  $1_H$  are the identities of  $G$  and  $H$ , respectively.
2.  $\phi(g^{-1}) = \phi(g)^{-1}$  for all  $g \in G$ .
3.  $\phi(g^n) = \phi(g)^n$  for all  $n \in \mathbb{Z}$ .
4.  $\ker\phi$  is a subgroup of  $G$ .
5.  $\text{im}\phi$ , the image of  $G$  under  $\phi$ , is a subgroup of  $H$ .

**Definition.** Let  $\phi: G \rightarrow H$  be a homomorphism with kernel  $K$ . The *quotient group* or *factor group*,  $G/K$  (read  $G$  modulo  $K$  or simply  $G \text{ mod } K$ ), is the group whose elements are the fibers of  $\phi$  with the following group operation: If  $X$  is the fiber above  $a$  and  $Y$  is the fiber above  $b$  then the product  $XY$  in  $G/K$  is defined to be the fiber above the product  $ab$  in  $G$ .

**Proposition 2.** Let  $\phi: G \rightarrow H$  be a homomorphism with kernel  $K$ . Let  $X \in G/K$  be the fiber above  $a$ , i.e.,  $X = \phi^{-1}(a)$ . Then

1. For any  $u \in X$ ,  $X = \{uk \mid k \in K\}$
2. For any  $u \in X$ ,  $X = \{ku \mid k \in K\}$

**Definition.** For any  $N \leq G$  and any  $g \in G$  let

$$gN = \{gn \mid n \in N\} \text{ and } Ng = \{ng \mid n \in N\}$$

called respectively a *left coset* and a *right coset* of  $N$  in  $G$ . Any element of a coset is called a *representative* for the coset.

**Theorem 3.** Let  $G$  be a group and let  $K$  be the kernel of some homomorphism from  $G$  to another group. Then the set of whose elements are left coset of  $K$  in  $G$  with operation defined by

$$uK \circ vK = (uv)K$$

forms a group,  $G/K$ . This operation is well defined and does not depend on the choice of representatives.

**Proposition 4.** Let  $N$  be any subgroup of the group  $G$ . The set of left cosets of  $N$  in  $G$  form a partition of  $G$ . Furthermore, for all  $u, v \in G$ ,  $uN = vN$  if and only if  $v^{-1}u \in N$  and in particular,  $uN = vN$  if and only if  $u$  and  $v$  are representatives of the same coset.

**Proposition 5.** Let  $G$  be a group and let  $N$  be a subgroup of  $G$ .

1. The operation on the set of left cosets of  $N$  in  $G$  described by

$$uN \cdot vN = (uv)N$$

is well defined if and only if  $gng^{-1} \in N$  for all  $g \in G$  and all  $n \in N$ .

2. If the above operation is well defined, then it makes the set of left cosets of  $N$  in  $G$  into a group. In particular the identity of this group is the coset  $1N$  and the inverse of  $gN$  is the coset  $g^{-1}N$ , i.e.,  $(gN)^{-1} = g^{-1}N$ .

**Definition.** The element  $gng^{-1}$  is called the *conjugate* of  $n \in N$  by  $g$ . The set  $gNg^{-1} = \{gng^{-1} \mid n \in N\}$  is called the *conjugate* of  $N$  by  $g$ . The element  $g$  is said to *normalize*  $N$  if  $gNg^{-1} = N$ . A subgroup  $N$  of a group  $G$  is called *normal* if every element of  $G$  normalizes  $N$ , i.e., if  $gNg^{-1} = N$  for all  $g \in G$ . If  $N$  is a normal subgroup of  $G$  we shall write  $N \trianglelefteq G$ .

**Theorem 6.** Let  $N$  be a subgroup of the group  $G$ . The following are equivalent:

1.  $N \trianglelefteq G$
2.  $N_G(N) = G$  (recall  $N_G(N)$  is the normalizer in  $G$  of  $N$ )
3.  $gN = Ng$  for all  $g \in G$
4. the operation on left cosets of  $N$  in  $G$  described in Proposition 5 makes the set of left cosets into a group
5.  $gNg^{-1} \subseteq N$  for all  $g \in G$ .

**Proposition 7.** A subgroup  $N$  of the group  $G$  is normal if and only if it is the kernel of some homomorphism.

**Definition.** Let  $N \trianglelefteq G$ . The homomorphism  $\pi: G \rightarrow G/N$  defined by  $\pi(g) = gN$  is called the *natural projection (homomorphism)* of  $G$  onto  $G/N$ . If  $\overline{H} \leq G/N$ , then *complete preimage* of  $\overline{H}$  in  $G$  is the preimage of  $\overline{H}$  under the natural projection homomorphism.

## 1.2 More on Cosets and Lagrange's Theorem

**Theorem 8.** (*Lagrange's Theorem*) If  $G$  is a finite group and  $H$  is a subgroup of  $G$ , then the order of  $H$  divides the order of  $G$  and the number of left cosets of  $H$  in  $G$  equals  $\frac{|G|}{|H|}$ .

**Definition.** If  $G$  is a group and  $H \leq G$ , the number of left cosets of  $H$  in  $G$  is called the *index* of  $H$  in  $G$  and is denoted by  $|G : H|$ .

**Corollary 9.** If  $G$  is a finite group and  $x \in G$ , then the order of  $x$  divides the order of  $G$ . In particular,  $x^{|G|} = 1$  for all  $x$  in  $G$ .

**Corollary 10.** If  $G$  is a group of prime order  $p$ , then  $G$  is cyclic, hence  $G \cong Z_p$  (note that this text uses  $Z_n$  to denote the cyclic group of order  $n$  written in multiplicative notation and that given any  $n \in \mathbb{Z}$ ,  $Z_n \cong \mathbb{Z}/n\mathbb{Z}$ ).

**Note.** For finite abelian groups the full converse of Lagrange's theorem holds, that is the group has a subgroup of order  $n$  for each  $n$  that divides the order of the group.

**Theorem 11.** (Cauchy's Theorem) If  $G$  is a finite group and  $p$  is a prime dividing  $|G|$ , then  $G$  has an element of order  $p$ .

**Theorem 12.** (Sylow) If  $G$  is a finite group of order  $p^\alpha m$ , where  $p$  is a prime not dividing  $m$ , then  $G$  has a subgroup of order  $p^\alpha$ .

**Definition.** Let  $H$  and  $K$  be subgroups of a group and define

$$HK = \{hk \mid h \in H, k \in K\}.$$

**Proposition 13.** If  $H$  and  $K$  are finite subgroups of a group then

$$|HK| = \frac{|H||K|}{|H \cap K|}.$$

**Proposition 14.** If  $H$  and  $K$  are subgroups of a group,  $HK$  is a subgroup if and only if  $HK = KH$ .

**Note.**  $HK = KH$  does not imply that the elements of  $H$  commute with the elements of  $K$

**Corollary 15.** If  $H$  and  $K$  are subgroups of  $G$  and  $H \leq N_G(K)$ , then  $Hk$  is a subgroup of  $G$ . In particular, if  $K \trianglelefteq G$ , Then  $HK \leq G$  for any  $H \leq G$  (Since if  $K \trianglelefteq G$ ,  $N_G(k) = G$ ).

**Definition.** If  $A$  is any subset of  $N_G(K)$  (or  $C_G(K)$ ), we shall say  $A$  *normalizes*  $K$  (*centralizes*  $K$ , respectively).

### 1.3 The Isomorphism Theorems

**Theorem 16.** (The First Isomorphism Theorem) If  $\phi: G \rightarrow H$  is a homomorphism, then  $\ker\phi \trianglelefteq G$  and  $G/\ker\phi \cong \phi(G)$ .

**Corollary 17.** Let  $\phi: G \rightarrow H$  be a homomorphism.

1.  $\phi$  is injective if and only if  $\ker\phi = 1$ .
2.  $|G : \ker\phi| = |\phi(G)|$ .

**Theorem 18.**
